# **Company Overview**

- **Established Presence:** AtliQ Grands is a leading five-star hotel chain in major Indian cities, known for luxury and toptier service. Despite 20+ years of excellence, recent market changes and rising competition have challenged its leadership.
- Hotel Properties: AtliQ Bay, AtliQ Blu, AtliQ City, AtliQ Exotica, AtliQ Grands, AtliQ Palace, AtliQ Seasons.
- City Locations: Hyderabad, Bangalore, Delhi, Mumbai.
- Room Categories/Class: Business, Luxury, Standard, Elite, Premium, Presidential.
- Booking Platforms: Direct Offline, Direct Online, Journey, LogTrip, MakeMyTrip, Tripster, Others.

# **AtliQ Grands Hotel Chain System**

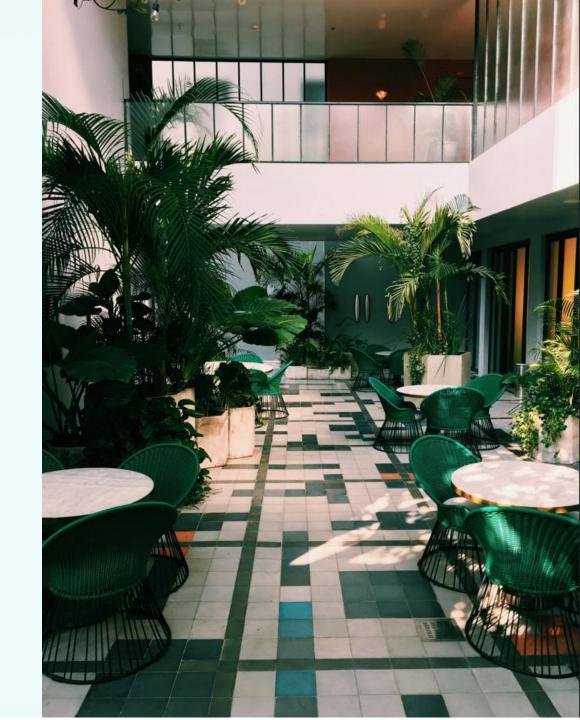

### **Each Property has the following 4 Types of Room classes:**

- Standard
- Elite
- Premium
- Presidential

## **Problem Statement**

- AtliQ Grands is losing market share and revenue due to poor decisions and a lack of data insights, while competitors use analytics to optimize performance. Without a data team, it's struggling to adapt.
- To address the issue, AtliQ Grands has hired a data analytics firm to extract insights from past data, improve decisions, identify revenue opportunities, and regain market leadership.

## **Project Overview**

## **Objective:**

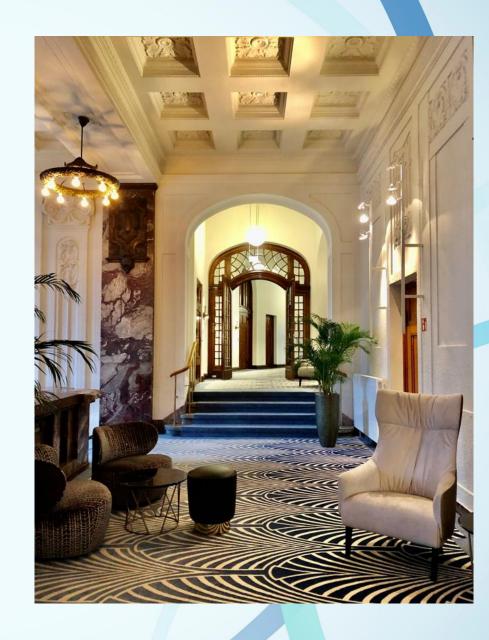

- Perform EDA on hotel booking and performance data to uncover key trends.
- Deliver insights to optimize revenue, room utilization, and seasonal planning.

## **Key Goals:**

- Analyse booking, revenue, guest behaviour, and occupancy trends across hotel types and periods.
- Generate insights to support strategic decisions and boost business performance.

### **Tech Stack:**

- Python (Jupyter Notebook) Core platform for data analysis
- Pandas, NumPy Data cleaning, transformation, and manipulation.
- Matplotlib, Seaborn Data visualization and trend analysis.

## **Solution Approach & Process**

## 1. Data Import & Exploration:

- Loaded multiple datasets into the Jupyter notebook.
- Checked the structure and basic statistics to understand the data.

## 2. Data Cleaning:

- Filled or removed missing values.
- Removed outlier values.
- Fixed inconsistent formats.

### 3. Data Transformation:

- Combined related datasets for better analysis.
- Created new columns to add more insights.
- Standardized values to make data consistent.

## 4. Insight Generation:

- Created charts to show trends by city, room type, and time.
- Analysed revenue and room occupancy to find key patterns.

# **Key Performance Indicators (KPIs)**

- ADR (Average Daily Rate) Total Rooms Revenue/ No. of Rooms Sold
- DSRN (Daily Sellable Room Nights) = Total Rooms Available to Sell/ No. of Days
- DURN (Daily Utilized Room Nights) = Total Checked out/ No. of Days
- DBRN (Daily Booked Room Nights) = Total Bookings/ No. of Rooms Sold
- Occupancy% = Total Rooms Occupied/ Total Rooms Available
- RevPAR (Revenue Per Available Room) = Total Revenue / Total Rooms Available to Sell
- Realization = DURN/DBRN

## **AtliQ Hospitality Domain Data Analysis Project**

```
In [1]: import pandas as pd
```

#### ==> 1. Data Import and Data Exploration

#### **Datasets**

We have 5 csv file

- dim\_date.csv
- dim\_hotels.csv
- dim\_rooms.csv
- fact\_aggregated\_bookings
- fact\_bookings.csv

#### Read bookings data in a dataframe

```
In [4]: # Load dimension tables
    df_date = pd.read_csv('datasets/dim_date.csv')
    df_hotels = pd.read_csv('datasets/dim_hotels.csv')
    df_rooms = pd.read_csv('datasets/dim_rooms.csv')

In [5]: # Load fact tables
    df_agg_bookings = pd.read_csv('datasets/fact_aggregated_bookings.csv')
    df_bookings = pd.read_csv('datasets/fact_bookings.csv')
```

#### **Explore bookings data**

```
df_bookings.head()

One observation we can have in above dataframe is that all rooms are RT4 which means presidential suit. Now since RT4 is a luxurious room it is likely their rent will be higher. To make a fair analysis, we need to do data analysis only on RT4 room types

         # mean + 3*standard deviation
         23439+3*9048 ## this is the higher limit for RT-4 rooms, beyond this value, it i
```

Out[53]: 50583

Here higher limit comes to be 50583 and in our dataframe above we can see that max value for revenue realized is 45220. Hence we can conclude that there is no outlier and we don't need to do any data cleaning on this particular column

          dtype: int64
```

The total values in our dataframe are 134576. Out of those 77897 rows, 77897 have a null rating. Since there are many rows with null ratings, we should not filter these values. Also, we should not replace this rating with a median or mean rating, etc.

In aggregate bookings, find columns that have null values. Fill these null values with whatever you think is the appropriate substitute (possible ways are to use mean or median)

```
df_agg_bookings.isnull().sum()
```

```
Out[56]: property_id 0 check_in_date 0 room_category 0 successful_bookings 0 capacity 2 dtype: int64
```

## **Strategic Insights**

- Mumbai leads in revenue, contributing 668.6M, followed by Bangalore, Hyderabad, and Delhi.
- Luxury rooms contributed the most (61.61%), while Business rooms contributed 38.39%.
- **Delhi** tops in **occupancy%** (60.5%) and rating (3.8).
- AtliQ Exotica earned 320M, with 57.3% occupancy, a 3.62 rating, and 24.37% cancellation.
- Weekend occupancy rose by 7%, though RevPAR stayed stable.
- Weekdays brought in 69.34% revenue; weekends 30.66%.
- May was the best month with 581.93M revenue.
- Elite rooms earned the highest (560M); Standard rooms the lowest (₹310M).
- Most bookings came from other sources, 55K (699M), followed by MakeYourTrip, 27K (314M).
   The lowest number of bookings came from direct offline, 7K (86M).

## Recommendations

- Improve Customer Ratings: Focus on service quality, cleanliness, and food to boost ratings and bookings.
- Use Dynamic Pricing: Adjust rates for weekdays/weekends to increase overall revenue.
- Reduce Cancellation Rates: Address high cancellations from Others and MakeMyTrip (25%), especially for Elite rooms.
- Price Based on Occupancy: Apply dynamic pricing for properties with low occupancy to improve room utilization and revenue.
